1 Introduction

1.1 In recent years there have been a number of developments in the use of aircraft RNAV systems, in particular for departure, arrival and final approach to landing. In response to these developments the CAA has produced guidance material for operators engaged in RNAV. This guidance was published in FODCOM 20/2007.

1.2 The purpose of this FODCOM is to continue to direct the attention of AOC holders to guidance material which covers training, operational issues and operational approval requirements for RNAV operations and similar Flight Management System (FMS) managed navigation procedures. This FODCOM supersedes FODCOM 20/2007 and includes revised and updated material following a recommendation from the UK Air Accident Investigation Branch (AAIB Formal Report 5/2007) following a serious incident (see paragraph 7.1 of Appendix A) and taking account of operational experiences with RNAV procedures in UK airspace (see paragraph 9.4 of Appendix A). Although principally aimed at AOC holders, this guidance may prove useful for private operators of complex aircraft, in particular where formal approval of operations is required.

2 Issue

2.1 The document provides guidance on flight crew training, operational issues and operational approval requirements for RNAV operations. It provides a clear statement of the terminology related to RNAV. It addresses en-route (B-RNAV), terminal (P-RNAV) and final approach operations (RNAV (GNSS) and RNP AR), as well as the use of RNAV systems to fly procedures based on conventional ground navigational aids (overlays). It does not cover long-range navigation, e.g. RNP-10, or North Atlantic Minimum Navigation Performance Specification (MNPS) operations.

2.2 The guidance is attached to this FODCOM (Appendices A, B, C and D) and in due course will be published on the CAA website to enable the information to be updated as required.

3 Recommendations

3.1 It is recommended that operators wishing to conduct any RNAV operations, including managed non-precision approach procedures:

- review current documentation to ensure the correct use of RNAV terminology;
- review current RNAV procedures and training requirements, together with their operations manual or other guidance texts, to ensure that they conform to the advice contained in the guidance material; and
- follow the guidelines contained in the guidance material when developing procedures and training requirements, and when developing operations manual and other guidance.

4 Queries

4.1 Any queries as a result of this FODCOM should be addressed to Head of Flight Operations Policy Department at the following e-mail address: FOP.Admin@caa.co.uk.

6 February 2008

Recipients of new FODCOMs are asked to ensure that these are copied to their 'in house' or contracted maintenance organisation, to relevant outside contractors, and to all members of their staff who could have an interest in the information or who need to take appropriate action in response to this Communication.
AREA NAVIGATION - CAA GUIDANCE MATERIAL

1 Introduction

1.1 The purpose of this document is to provide guidance to AOC holders on training, operational issues and operational approval requirements for area navigation (RNAV) operations and similar Flight Management Systems (FMS) managed navigation procedures. A further aim is to provide a clear statement of the terminology related to RNAV. Although principally aimed at AOC holders, this guidance may prove useful for private operators of complex aircraft, in particular where formal approval of operations is required. A Glossary of Terms is found at Appendix B.

2 Scope

2.1 This document provides guidance on flight crew training, operational issues and operational approval requirements for RNAV operations. It addresses en-route (B-RNAV), terminal (P-RNAV) and final approach operations (RNAV (GNSS) and RNP AR), as well as the use of RNAV systems to fly procedures based on conventional ground navigational aids (overlays). It does not cover long-range navigation, e.g. RNP-10, or North Atlantic Minimum Navigation Performance Specification (MNPS) operations.

3 Performance Based Navigation (PBN) Concepts

3.1 Over the last 10 to 15 years the regional implementation of RNAV has led to a proliferation of area navigation descriptions, approval requirements and terms. This has resulted in confusion and has drawn criticism from aircraft manufacturers and operators alike. In 2004, the International Civil Aviation Organization (ICAO) recognised that the RNAV concepts envisaged in the mid 1980s and early 1990s were outdated and that the current global guidance material provided in the Required Navigation Performance (RNP) Manual (ICAO Document 9163) needed to be revised. ICAO will publish a PBN Manual in 2008. A final draft of the manual is available at www.icao.int/pbn. This draft manual deals comprehensively with all RNAV matters and goes a long way to rectifying existing confusion. Aircraft navigation will for the first time be harmonised globally and a process put in place for the future design of airspace based around RNAV and RNP concepts.

3.2 Aircraft navigation has already evolved to the point where realisable benefits can be gained from RNAV in the en-route, terminal airspace and final approach flight phases. The lateral performance available from modern navigation sensors (including GNSS) means that reduced separation and obstacle clearance can bring about increased capacity and greater access. The functionality of RNAV systems, some with built-in performance monitoring and alerting algorithms, enables trajectories with predictable, repeatable path definition to be flown, providing environmental relief (reduced noise and emissions) together with fuel savings from direct routings.

3.3 In the longer term, there is likely to be an increased dependence upon advanced RNAV operations. With the continuing growth in traffic and the need to mitigate environmental impact to the greatest extent possible, RNAV, together with a transition to a GNSS-based navigation environment, is key to delivering the benefits being sought. The capability of aircraft navigation systems will evolve to meet new and developing requirements. RNP is seen as the likely enabler in the future European Air Traffic Management (ATM) concept and work is already under way to identify functional and operational requirements for both airborne systems and air traffic control system tools necessary to support this future. Within European terminal airspace, the goals for 2020+ include evolving from today’s arrival and departure procedures which just specify a lateral (2-D) accuracy requirement to a system of navigation having vertical performance (3-D) and eventually Required Time of Arrival (4-D) performance.

3.4 In parallel with airborne systems development, the Air Navigation Service Providers (ANSP) and their regulators are looking at the infrastructure necessary to support future ATM concepts. Further rationalisation of the traditional ground-based navigation infrastructure is anticipated, leading to a navigation architecture based on GPS and Galileo GNSS constellations with Distance Measuring Equipment (DME) as a back-up.

3.5 At the international level, as new navigation specifications are developed they will be ratified by ICAO and then included within the PBN Manual enabling adoption as world-wide, harmonised standards.
3.6 Further information on developments of future RNAV and RNP standards affecting UK airspace will be promulgated through Aeronautical Information Circulars (AIC).

4 Operational approval requirements for RNAV operations

4.1 It is not always apparent to airspace users how navigation specifications fit into the overall safe and efficient use of the airspace. In particular, attention is often focused on the aircraft system accuracy requirements, whereas for the ANSP the separation standards, integrity of navigation and repeatability of adherence to the flight paths can be an equally important part of the overall safety management of the airspace. The granting of an approval to an operator provides an assurance to the ANSP that all of the navigation concept assumptions of accuracy, integrity and interoperability are met. Consequently, it may be necessary to provide additional training and oversight to meet the required level of assurance.

4.2 The operator will need to demonstrate that they have robust training and procedures in place to ensure compliance with the navigation specification (e.g. P-RNAV, B-RNAV, RNP, etc.). This may require a demonstration or trial in the simulator or aircraft to the satisfaction of the assigned Flight Operations Inspector (FOI).

5 Aircraft eligibility

5.1 The on-board RNAV systems must be fit for the intended purpose. Operators must be satisfied that a particular operation is supported by an airworthiness approval reflected in the flight manual or other approved manufacturer’s documentation, such as flight crew operating manual or pilot operating handbook. When approving an operator for any new RNAV operation the CAA will need to be shown the evidence of airworthiness suitability.

6 Specific Approval Processes

6.1 Below is a brief summary of the approval requirements for specific RNAV Navigation Specifications/RNAV applications:

   a) European Basic RNAV (B-RNAV)

      Approval is required under JAR-OPS 1/3.243, conferred by an entry in the Operations Specification. Procedures and a training syllabus must be included in the operations manual and have been accepted by the assigned FOI. Non-AOC holders are not required to hold an approval for B-RNAV operations solely in UK airspace. The requirements of other European States may be different.

   b) European Precision RNAV (P-RNAV)

      Approval is required under Article 59 of the Air Navigation Order 2005, and under JAR-OPS 1/3.243, conferred by an entry in the Operations Specification (AOC holders only). All operators requiring a P-RNAV approval shall apply to the CAA using Form CA4045.

   c) Use of RNAV systems to fly conventional non-precision approaches, i.e. overlays of conventional non-precision approaches and overlays of Standard Instrument Departures (SID) and Standard Arrivals (STARS)

      Prior to commencing these operations, the assigned FOI must have signified acceptance of relevant procedures and training specified in the operations manual.

   d) RNAV (GNSS) approach operations

      Prior to commencing RNAV (GNSS) approach operations, a submission shall be made to the CAA through the assigned FOI. This submission should detail the changes to operational procedures, operations manual entries, Minimum Equipment List (MEL) and the training syllabus, together with a plan for identification of hazards and the management of the risks associated with the introduction of the new approach type. The Operations Specification will be annotated to include RNAV (GNSS) final approach.
e) RNP Authorisation Required (RNP AR)

These procedures are designed for RNAV systems with Required Navigation Performance (RNP) capability. Flight crews operating on these procedures will require additional training over and above that required for RNAV (GNSS). In the United States these procedures are referred to as Special Aircraft and Aircrew Authorisation Required (SAAAR) (see FAA AC 90-101).

An operator wishing to fly these approaches shall make a submission to the CAA through the assigned FOI. This submission should detail the changes to operational procedures, operations manual entries, MEL and the training syllabus, together with a plan for identification of hazards and the management of the risks associated with the introduction of the new approach type. The Operations Specification will be annotated to include RNP AR.

Note: Currently no UK operators have experience of RNP AR operations. It is therefore essential that any operator intending to introduce these operations contact the CAA, through the assigned FOI, at the earliest opportunity.

7 Implementation considerations

7.1 When producing documents and procedures to support the introduction of an RNAV operation the following list may prove useful to an operator. The list is not exhaustive.

- Introduction – examining the application of differing navigation procedures.
- Definitions – an explanation of RNAV terms, relating them to the standard terms (see Appendix B), and how they are used as part of the operating procedures.
- Hazard analysis leading to a plan for the management of risks associated with the introduction of the new navigation procedures.
- Aircraft installation – overview of the systems incorporated within the aircraft.
- Aircraft navigation – explanation of the aircraft navigation systems.
- GPS/FMS – general overview of the on-board navigation system and satellite constellation (if used) or general reference to aircraft systems for maintaining accuracy. Where applicable, implications of the availability of the satellite navigation constellation on navigation accuracy should be detailed.
- MEL – dispatch requirements and the effects on navigation due to system failures.
- Navigation database production – requirements for Letter of Acceptance from database supplier and quality assurance requirements.
- Feedback procedures for reporting RNAV deficiencies to the operator’s department responsible for navigation database and, if appropriate, onwards transmission to database supplier.
- RNAV procedures – Manufacturer’s Standard Operating Procedures (SOPs) or approved operator defined procedures.
- Briefing of the procedure prior to commencement – particularly important with respect to approach operations.
- Charting/FMS database consistency – procedures to detect potential discrepancies.
- ATC and R/T phraseology – introduction to the ATC environment and R/T procedures (see ICAO Doc 7030 ICAO EUR Regional Supplementary Procedures).
- Abnormal procedures – contingency identification and actions to be taken.
- Procedures for the application of RNAV aerodrome operating minima.
- Flight crew training – training requirements for all types of RNAV operation.

8 Navigation Database

8.1 The correct coding of the navigation database is fundamental to all RNAV operations. The use of a coded flight procedure must enable the aircraft to follow the published profile with the required integrity and accuracy without an increase in pilot workload.

8.2 Listed below are a number of points to help ensure the adequacy of the navigation database. The list is not exhaustive, nor is it expected that all of the items must be achieved for all RNAV operations. However, where the consequence of the aircraft not adhering to the flight procedure poses a greater risk to the aircraft, such as RNAV final approach, then all five elements should be considered:
• The navigation database should be supplied from an ED-76/DO-200A qualified entity;
• The operator should apply the quality process required by JAR-OPS 1/3.035 in relation to the navigation database supplier;
• The operator should perform spot checks of the navigation database against the published procedures, concentrating on higher risk elements and changes. Use can be made of software tools;
• RNAV flight procedures, when identified as novel, complex or in close proximity to mountainous terrain, should be flown in the simulator and trialled in the aircraft to ensure that the operator’s aircraft can adhere to the procedure;
• There should be a feedback system in place, which includes the database supplier, to ensure that anomalies are reported swiftly and erroneous procedures withdrawn.

Note: The JAA has recently completed a public consultation proposing to include specific rule material in JAR-OPS 1/EU-OPS relating to the management of electronic navigation data for all airborne navigation applications. These proposed rules mirror ICAO Standards and Recommended Practices. Future updates to this document will include these proposals.

9 Training

9.1 A modular guide for RNAV training can be found at Appendix C. This details the minimum training the CAA considers necessary for specific RNAV procedures/Navigation Specifications.

9.2 The guide includes a basic package of training applicable to all RNAV operations. There are then four additional training modules for the various types of RNAV operation considered. Initially, the basic training package must be completed along with one other individual module. Thereafter additional modules can be added as necessary. It should be noted that pilots previously experienced in RNAV operations with a JAA operator can be considered to have met the training requirement for B-RNAV.

9.3 The training in the use of RNAV systems to fly conventional non-precision approaches (NDB, VOR, etc.) referred to as overlay procedures is specified separately. However, because this method of flying contains elements identical to that of flying an RNAV final approach, credit can be taken when both these operations are trained together, or sequentially. If credit for training in both of these operations is taken, operators should ensure that, where feasible, procedures for using RNAV equipment to fly conventional non-precision approaches mirror those used for RNAV final approaches.

9.4 In addition to specific flight crew training (as mentioned above), training packages should emphasise any relevant airspace management issues, e.g. compliance with relevant speed and altitude constraints associated with a procedure (see paragraphs 3.2 and 3.3 above). Specific instructions may be necessary for configuration of the aircraft under either manual or automatic control to ensure adherence to the nominal path, e.g. departure procedure turns. Finally, consideration should be given within flight crew SOPs for handling potential last minute runway changes.

9.5 RNAV training may be integrated into initial aircraft conversion training programmes. The requirements for RNP AR training will be added at a later date.

9.6 Further information on RNAV is found at Appendix D.
The following is an explanation of some of the terms used in RNAV procedures. Where possible the ICAO (or the most widely accepted) explanations have been used. It is recognised that the proliferation of terms is a safety concern and the CAA is supporting efforts to rationalise and harmonise the terms in use. Some of the terms in use below may therefore be subject to change and may be considered superfluous. Nevertheless, it is felt important to identify as many as possible to help clear up confusion.

**Aircraft-Based Augmentation System (ABAS).** An augmentation system that augments and/or integrates the information obtained from GNSS elements with all the other information available on board the aircraft.

**Airspace Concept.** An Airspace Concept provides the outline and intended framework of operations within an airspace. An Airspace Concept is essentially a high-level statement of an airspace plan. Airspace Concepts are developed to satisfy explicit strategic objectives such as improved safety, increased air traffic capacity and mitigation of environmental impact. Airspace Concepts include details of the practical organisation of the airspace and its users based on particular CNS/ATM assumptions, e.g. ATS route structure, separation minima, route spacing and obstacle clearance.

**Approach procedure with vertical guidance (APV).** An instrument procedure which utilises lateral and vertical guidance but does not meet the requirements established for precision approach and landing operations.

**Area navigation (RNAV).** A method of navigation which permits aircraft operation on any desired flight path within the coverage of station-referenced navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

*Note: Area navigation includes performance based navigation as well as other RNAV operations that do not meet the definition of performance based navigation.*

**Area navigation route.** An ATS route established for the use of aircraft capable of employing area navigation.

**B-RNAV.** A European RNAV navigation specification with a required track keeping accuracy of ±5 NM for at least 95% of the flight time. B-RNAV capability can be achieved using inputs from VOR/DME, DME/DME or GNSS and/or INS.

**Critical DME.** A DME facility that, when unavailable, results in a navigation service which is insufficient for DME/DME or DME/DME/IRU based operations along a specific route or procedure. These services are defined based on the minimum charted requirements for that procedure.

**EGNOS.** European Geostationary Navigation Overlay Service. A European version of Satellite Based Augmentation System (q.v.). It uses a network of ground stations over the whole of Europe which continually analyse the satellite signals from GPS, GLONASS and Galileo. From this analysis, correction and integrity signals are sent to geostationary (INMARSAT) satellites and then rebroadcast for navigation satellite system users to apply. It should be noted that SBAS enabled GNSS receivers are needed in order to use EGNOS correction signals.

**Letter of Acceptance (LOA)**

**Type 1 LOA** - Letter of acceptance granted where a navigation database supplier complies with EUROCAE ED-76/RTCA DO-200A documents with no identified compatibility with an aircraft system. A Type 1 LOA confirms that the processes for producing navigation data comply with these conditions and the documented Data Quality Requirements. A Type 1 LOA holder may not release navigation databases directly to end users.

**Type 2 LOA** - Letter of acceptance granted where a navigation database supplier complies with EUROCAE ED-76/RTCA DO-200A documents and provides data compatible with specified avionics systems. A Type 2 LOA confirms that the processes for producing navigation data comply with these conditions and the documented Data Quality Requirements for the avionics systems specified. The Data Quality Requirements must be provided by or agreed with the specified equipment design organisation in accordance with a formal arrangement. A Type 2 LOA holder may...
release navigation databases directly to end users. Such releases may also include data packing tools, where the use of such tools has been demonstrated to be ED-76/DO-200A compliant. A Type 2 LOA holder may interface directly with data originators (such as State AIP providers and operators), or may use data supplied by a Type 1 LOA holder in which case interfaces with data originators may not be necessary.

**Localizer Performance with Vertical Guidance (LPV).** A US term for an augmented GNSS approach utilising geometric vertical navigation with the following FAA definition. A type of approach with vertical guidance (APV) based on WAAS, published on RNAV (GPS) approach charts. This procedure takes advantage of the more precise lateral guidance available from WAAS enabled GNSS receivers. The approach minimum is published as a decision altitude (DA).

**Navigation Aid Infrastructure.** Navigation aid infrastructure refers to space-based and/or ground-based navigation aids available to meet the requirements in the navigation specification.

**Navigation Application.** The application of a navigation specification and the supporting navigation aid infrastructure to routes, procedures and/or defined airspace volume, in accordance with the intended airspace concept.

*Note:* The navigation application is one element, along with communication, surveillance and ATM procedures, meeting the strategic objectives in a defined airspace concept.

**Navigation Function.** The detailed capability of the navigation system (such as the execution of leg transitions, parallel offset capabilities, holding patterns and navigation databases) required to meet the Airspace Concept.

*Note:* Navigational functional requirements are one of the drivers for selection of a particular navigation specification.

**Navigation Specification.** A navigation specification is a set of aircraft and flight crew requirements needed to support Performance Based Navigation operations within a defined airspace. There are two kinds of navigation specification:

- **RNAV X.** A navigation specification designation that does not include requirement for on-board performance monitoring and alerting.
- **RNP X.** A navigation specification designation that includes requirements for on-board performance monitoring and alerting.

*Note:* For both RNP X and RNAV X, the expression 'X' refers to the lateral navigation accuracy in nautical miles that is expected to be achieved at least 95 per cent of the flight time.

**Overlays.** The use of RNAV systems to fly instrument flight procedures that are themselves based on conventional ground navigational aids and can be flown without the use of an RNAV system.

**Pseudorange.** A term used to describe the complex signals transmitted by GNSS satellite vehicles, which contain both range and additional information from each satellite vehicle in view to a receiver. Once processed by the GNSS receiver, ranges from each satellite vehicle are extracted enabling an accurate position to be determined. In addition, this processing also extracts accurate time.

**Performance Based Navigation.** Performance Based Navigation specifies system performance requirements for aircraft operating along an ATS route, on an instrument approach procedure or in an airspace block. Performance requirements are defined in terms of the accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

**P-RNAV.** A European RNAV navigation specification with a required track-keeping accuracy of ±1 NM for at least 95% of the flight time, together with advanced functionality and a high integrity navigation database. P-RNAV capability can be achieved using inputs from DME/DME or GNSS and/or INS.

**Receiver Autonomous Integrity Monitoring (RAIM).** A technique whereby a GNSS receiver processor determines the integrity of the GNSS navigation signals using only GPS signals or GPS signals and altitude.
This determination is achieved by a consistency check against additional satellite vehicle pseudorange (q.v.) or altitude measurements. Additional, in this context, means more satellite vehicles in view than are needed for position calculation; i.e. for a 2-D position, a minimum of three satellites need to be in view of the receiver; a 3-D solution requires a minimum of four satellites.

**RNAV 1 SID/STAR (FAA Operations).** Procedures requiring system performance currently met by GPS or DME/DME/IRU RNAV systems satisfying the criteria discussed in FAA AC 90-100A. RNAV 1 procedures may require the aircraft’s track-keeping accuracy remain bounded by ±1 NM for 95% of the total flight time.

**RNAV 2 SID/STAR (FAA Operations).** RNAV terminal procedures requiring system performance currently met by GPS or DME/DME/IRU RNAV systems satisfying the criteria discussed in FAA AC 90-100A. RNAV 2 terminal procedures require the aircraft’s track-keeping accuracy remain bounded by ±2 NM for 95% of the total flight time.

**RNAV (GNSS).** Approach operations. Basic approach operations in designated European airspace. Initially designed as 2-D RNAV (GNSS) with no vertical guidance, i.e. non-precision. EASA AMC development is expected to expand the utilisation of the Aircraft VNAV function for vertical guidance. Baro-VNAV approach procedures are to be classified by ICAO as APV (q.v.). Referred to as RNP APCH in the draft ICAO PBN Manual as the application requires on-board performance monitoring and alerting. For charting purposes will remain as RNAV (GNSS).

**RNAV Operations.** Aircraft operations using an area navigation system for RNAV applications. RNAV operations include the use of area navigation for operations which are not developed in accordance with the PBN Manual.

**RNAV System.** A navigation system which permits aircraft operation on any desired flight path within the coverage of station-referenced navigation aids or within the limits of the capability of self-contained aids, or a combination of these. An RNAV system may be included as part of a Flight Management System (FMS).

**RNP AR APCH.** RNP Authorisation Required Approaches represent the ICAO equivalent to FAA RNP Special Aircraft and Aircrew Authorization Required (SAAAR) operations.

**RNP System.** An area navigation system which supports on-board performance monitoring and alerting.

**RNP Operations.** Aircraft operations using an RNP System for RNP applications.

*Note:* Some flight management systems use the term RNP as either a containment value or measure of likely system navigation performance. This rather loose use of “RNP” is a source of confusion.

**Satellite Based Augmentation System (SBAS).** A wide area coverage augmentation system for satellite navigation systems (GPS, GLONASS, Galileo). An SBAS requires a network of ground stations across the area of augmentation and one or more geostationary satellites able to broadcast signals over this area. The ground stations continually monitor the signals from the satellite navigation system of interest, and from an analysis of the signals integrity information and accuracy corrections can be provided for the whole of the augmentation area. The correction signals are sent from a ground master station to the geostationary satellite and re-broadcast. Few aeronautical standard receivers are currently configured to receive SBAS signals. The United States SBAS is known by the acronym WAAS (q.v.) whilst the Europeans have EGNOS (q.v.), with the Japanese developing MSAS (Multi-functional Satellite Augmentation System).

**Vertical Navigation (VNAV).** A method of navigation which permits aircraft operation on a vertical flight profile using altimetry sources, external flight path references, or a combination of these.

**Wide-Area Augmentation System (WAAS).** This is the term for the US satellite based augmentation system (SBAS) (q.v.) which augments the GPS Standard Positioning Service (SPS). It provides enhanced integrity, accuracy, availability and continuity to the SPS over the contiguous United States.

| P-RNAV            | Basic RNAV Concept Training; and training in the following topics:  
• Airspace where P-RNAV is required;  
• Navigational equipment required to be operational for flight in designated P-RNAV airspace, and the limitations associated with P-RNAV equipment including MEL issues;  
• Flight Planning requirements;  
• Charting, database and avionics issues including RNAV path terminator concepts especially:  
  a) Use of the ‘CF’ path terminator;  
  b) Use of the ‘TF’ path terminator;  
• Use of RNAV equipment including:  
  a) Retrieving a procedure from the database, briefing the procedure, comparing it with the charted procedure and action to be taken if discrepancies are noted;  
  b) Using the autopilot, flight director and autothrottle at different stages of the procedure;  
  c) Flight mode annunciations;  
• Flying the procedure including:  
  a) Use of lateral navigation mode and associated lateral control techniques;  
  b) Use of vertical navigation mode and associated vertical control techniques;  
• Contingency procedures. | Some or all of:  
• Operations Manual content;  
• Handouts (paper or electronic);  
• CBT;  
• Classroom; and  
• Flight Simulator Training including:  
  a) At least three P-RNAV procedures flown by each crew to include departure and arrival;  
  b) Failures such as map shift, sensor failure etc. | Initial operator conversion training as per column 3.  
For currency Operator Proficiency Check (OPC) to include P-RNAV arrival with abnormality (see overlay procedures). |

Note: Credit may be given/taken for previous Basic RNAV Concept Training when adding a qualification for P-RNAV operations.
